Experiment -2.2

AIM: To create an MFA on a new AWS account

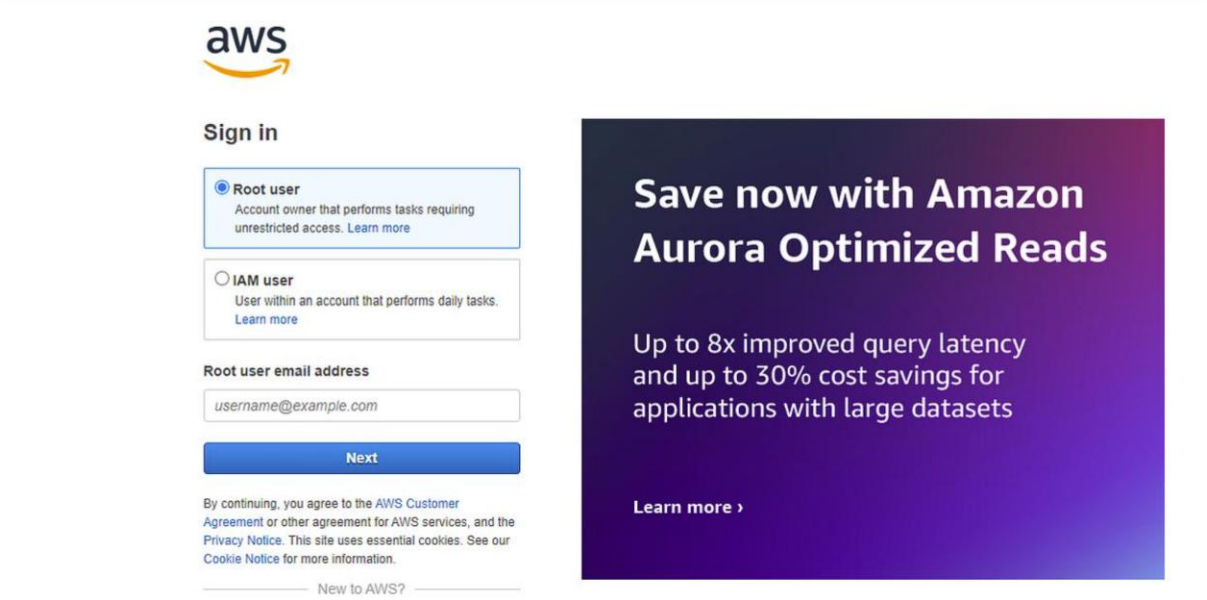

Description: Multi-Factor Authentication (MFA) was enabled on the AWS root account using the Google Authenticator mobile application. MFA provides an additional layer of security by requiring a time-based 6-digit verification code along with the AWS account password during login.

Steps:

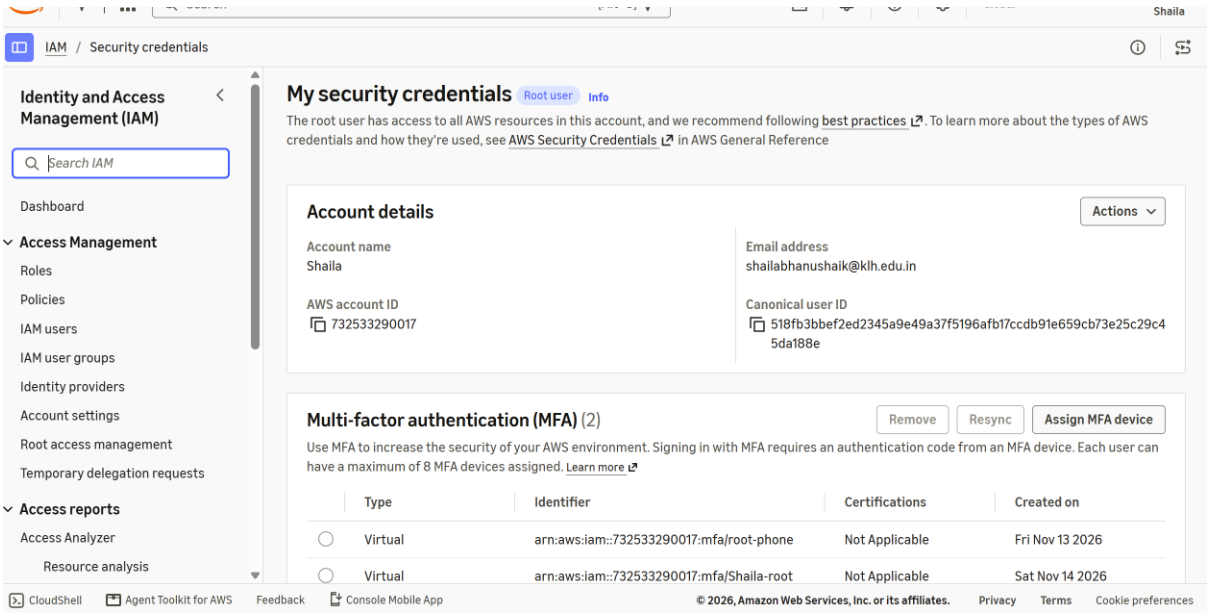

1. **Installed and opened the Google Authenticator application on the mobile phone.**

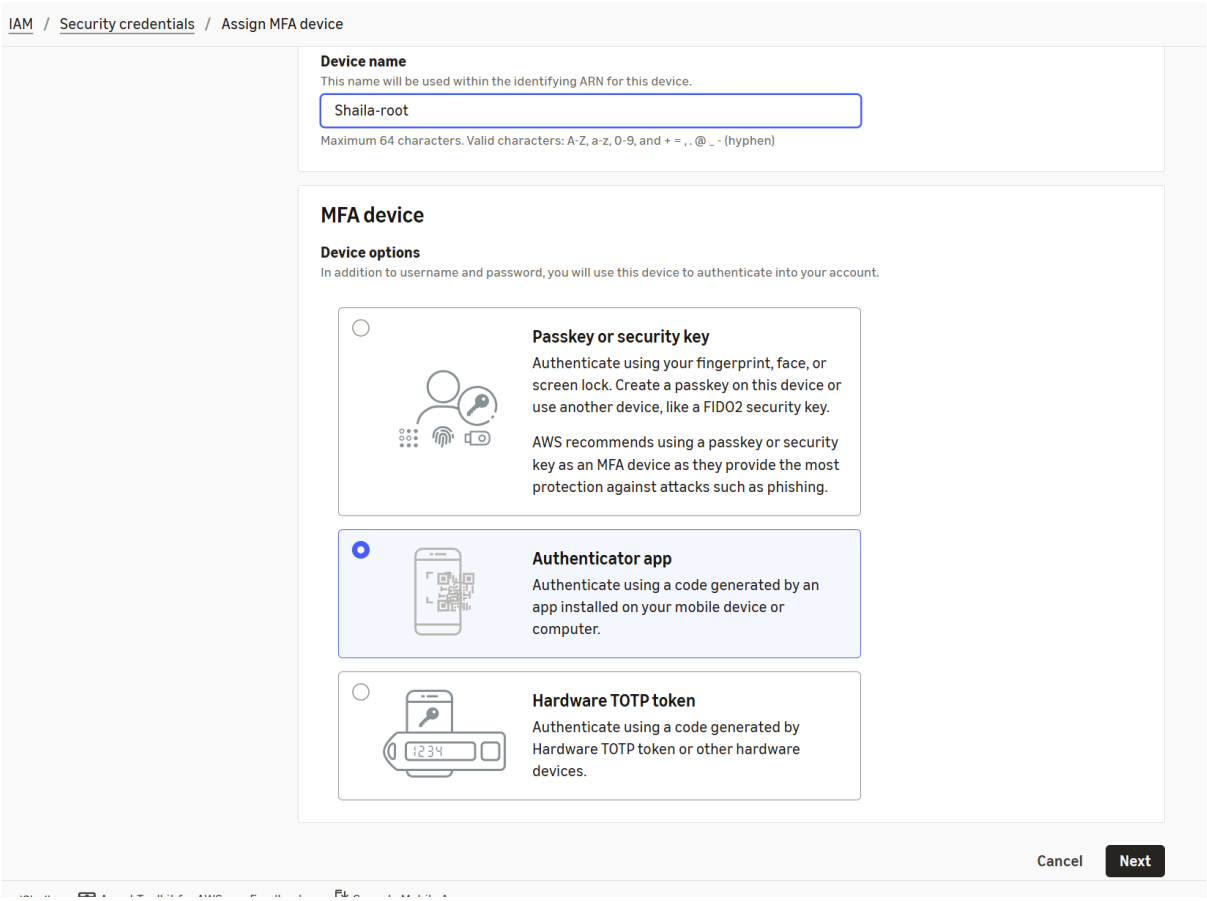

2. **Logged in to the AWS Management Console using the root user credentials.**

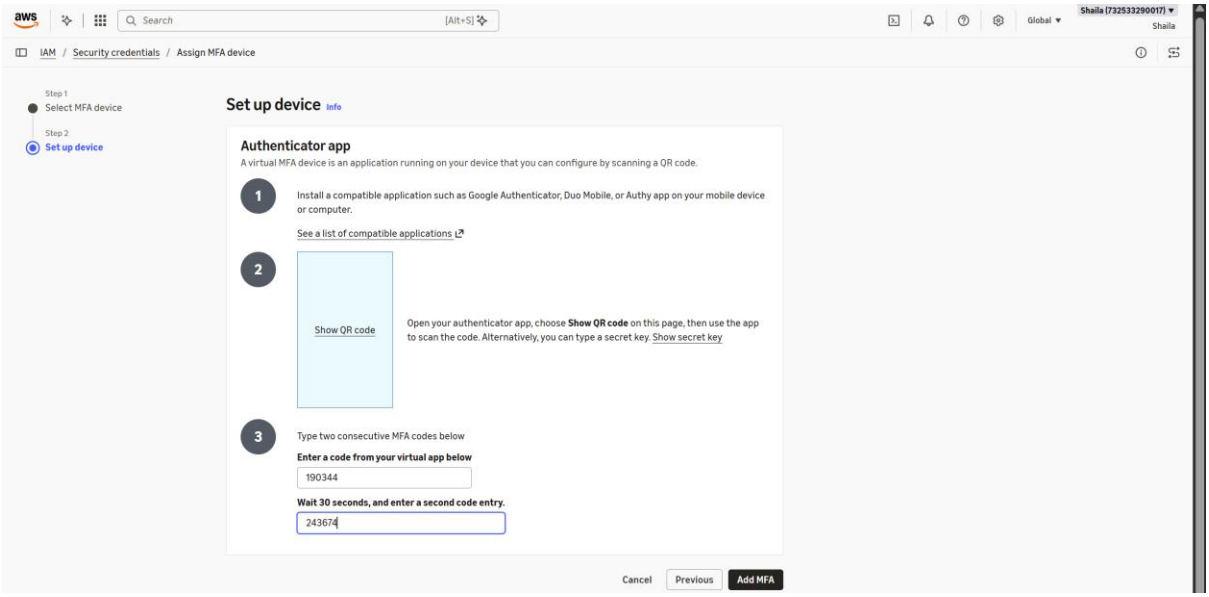

3. **Clicked the account name in the top-right corner and selected Security credentials.**

4. **Navigated to the Multi-Factor Authentication (MFA) section.**
5. **Clicked Assign MFA device.**

6. **Entered the device name as root-phone.**
7. **Selected Authenticator app and clicked Next.**
8. **Scanned the QR code displayed on the AWS console using Google Authenticator.**
9. **Entered the first 6-digit verification code in MFA code 1.**
10. **Waited for the code to change and entered the second verification code in MFA code 2.**
11. **Clicked Add MFA to complete the setup.**

12. Verified that the MFA device was successfully registered with the AWS root account.

13.
